SQL DATA ANALYTICS PORTFOLIO PROJECT

STARTUP FUNDING ANALYSIS

SQL Data Analytics Project Report

A SQL (MySQL) analysis of startup funding records by industry, city, investment type and time, with documented data-quality checks.

3,044
funding records

2,459
unique startup names

$38.07B
disclosed numeric funding

Figures calculated from the provided startup_funding.csv dataset; data limitations are documented in Section 09.

Prepared from the provided startup_funding.csv dataset

SQL Data Analytics Portfolio Project

02 Project Summary

What the data shows and how it was measured

The dataset contains 3,044 funding records and 2,459 distinct startup names. Numeric funding values exist for 2,066 records (67.9%); 978 records hold undisclosed, unknown or otherwise non-numeric amounts. The sum of disclosed numeric amounts is $38.07 billion, with an average of $18.43 million and a median of $1.73 million among records that have a numeric amount. All amounts are treated as USD, following the source column heading.

The analysis was carried out with SQL (MySQL) queries on the startup_funding.csv dataset. It answers twenty questions (Q1–Q20), from basic aggregation to ranking, window functions and a data-quality audit.

1 Funding is concentrated

Private Equity accounts for $26.64B of the $38.07B disclosed total, and Bengaluru for $18.47B.

2 Activity is not capital

Consumer Internet has the most records (941), but E-commerce leads industry funding ($8.26B, 21.7%).

3 Rounds drive the trends

2017 has the highest yearly total ($10.43B) and August the highest month ($9.69B).

4 Cumulative vs single round

Flipkart has the highest cumulative funding ($4.06B); Rapido Bike Taxi has the largest single record ($3.90B).

KEY OBSERVATION

The record count (3,044) and unique-name count (2,459) are different measures. The 585-record difference can reflect multiple rounds per startup or name-spelling variations; it is not evidence of fraud or duplicate full records.

METHODOLOGY NOTE

Totals and averages describe disclosed numeric amounts only. Because 978 rows have no usable amount, funding figures in this report are quoted together with the 67.9% amount coverage.

How to read this report

Label	Meaning
CALCULATED FROM THE CSV	Figure or finding calculated from startup_funding.csv.
DERIVED FROM REPORTED FIGURES	Simple arithmetic on reported figures; no new data introduced.
DATA LIMITATION	A limitation or inconsistency in the data that affects interpretation.
METHODOLOGY NOTE	How a figure was calculated or which assumption was used.
KEY OBSERVATION	Interpretation that follows from the reported figures.

03 Key Performance Indicators

Headline metrics calculated from the provided CSV

3,044
Funding Records

2,459
Unique Startup Names

$38.07 Billion
Total Disclosed Funding

$18.43 Million
Average Disclosed Amount

$1.73 Million
Median Disclosed Amount

$3.90 Billion
Largest Single Record

$0.02 Million
Smallest Positive Amount

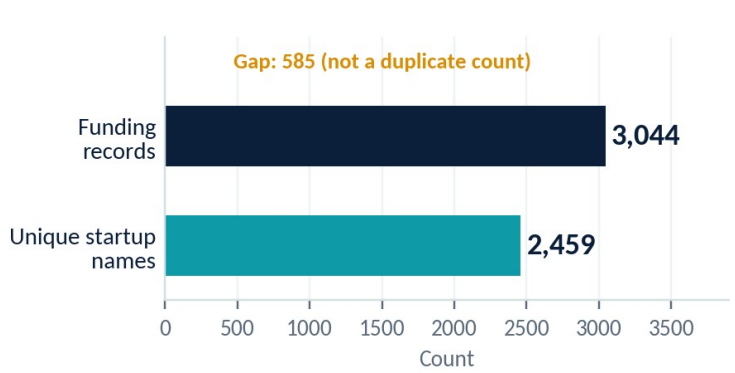

2,066
Records with Numeric Amount (67.9%)

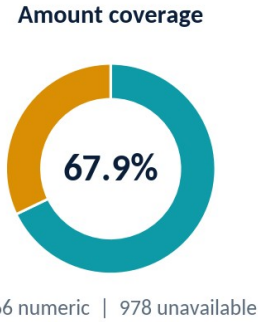

978
Amounts Unavailable

DATA LIMITATION

Averages and the median use only the 2,066 numeric-amount rows. The $3.90B maximum is a single record, and the $0.02M minimum is the smallest positive amount; there are no numeric zero rows. Both are reported as found in the dataset.

Records vs unique startup names, and amount coverage

The gap between records and unique names is not a duplicate count. One in three records (978 of 3,044) has no numeric amount.

KEY OBSERVATION

The median ($1.73M) sits far below the average ($18.43M): a small number of very large rounds pull the average up, so the median is the better guide to a typical round.

04 Dataset Overview and Analysis Objectives

Source fields, parsing rules and grouping decisions

Source: startup_funding.csv (3,044 rows; 10 original columns). The raw CSV is left unchanged; all cleaning is applied in the analysis.

Topic	Rule applied
Amounts	Commas and a trailing plus sign removed. Text such as “undisclosed” and “unknown” treated as unavailable, not as zero. Amounts treated as USD.
Dates	Day-first parsing. Eight malformed date strings were corrected (for example 01/07/015 became 01/07/2015). No dates remain unparsed.
Cities	Bangalore/Bengaluru, Gurgaon/Gurugram and Delhi/New Delhi combined into Bengaluru, Gurugram and New Delhi.
Industries	Common e-commerce spelling variants grouped as E-commerce; other labels kept close to source to avoid unsupported merges.
Investment types	55 non-empty labels before standardization; whitespace and selected Seed/Angel variants standardized.
“Unknown”	Used only to group missing or placeholder labels in visuals.

Analysis objectives

1 Baseline metrics

Establish baseline metrics for the dataset.

2 Compare categories

Compare industries, cities and investment types.

3 Time patterns

Review yearly and monthly funding patterns.

4 High-value records

Identify high-value funding records and frequently recorded investor names.

5 Data audit

Audit missing values, inconsistent labels and duplicate full records.

METHODOLOGY NOTE

Amounts are treated as USD, following the source column heading. Averages are calculated over the 2,066 numeric-amount rows; dividing the total by all 3,044 records would give $12.51M, but that would treat undisclosed amounts as zero, so it is not used.

05 Basic Analysis — Q1–Q5

Dataset profiling: baseline metrics, unique names, industry, city and investment type

Q1 Overall funding summary

There are 3,044 records, 2,459 distinct startup names and 2,066 numeric funding amounts. Total disclosed funding is $38.07B; average and median disclosed amounts are $18.43M and $1.73M.

CALCULATED FROM THE CSV

All Q1 figures are calculated from the supplied CSV.

Q2 Unique startups

There are 585 more funding records than distinct startup names. This can reflect multiple funding records per startup or name-format variation; it does not mean there are 585 duplicate companies.

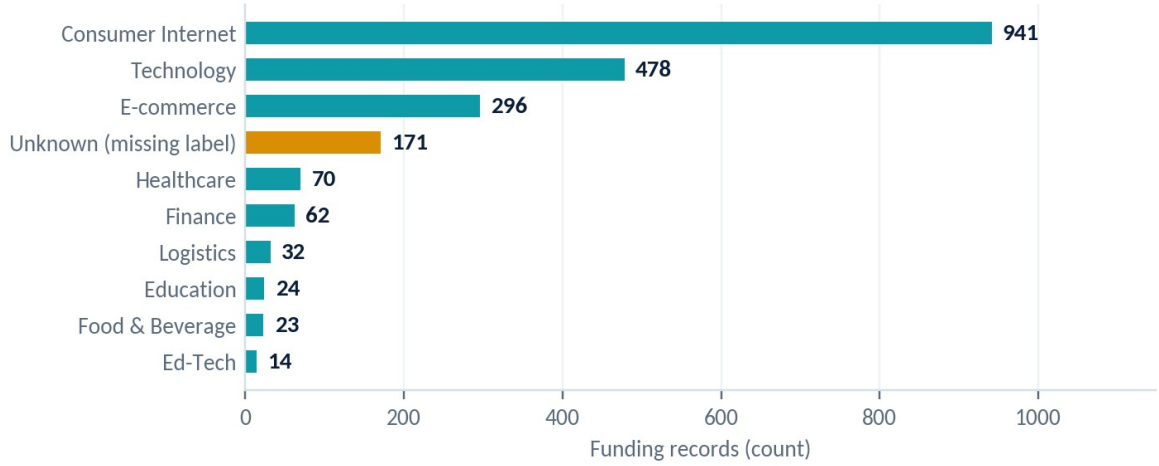

KEY OBSERVATION

Report “funding records” and “unique startup names” as separate measures; never present record count as number of companies.

Q3 Industry distribution

Industry labels ranked by number of records; missing or placeholder labels appear as Unknown. The source has many distinct industry labels, so the ten most frequent groups are shown.

Chart 2 | Funding records by industry (top 10)

Consumer Internet (941) and Technology (478) lead by record count. 171 records have no industry label, more than Healthcare (70) and Finance (62) combined.

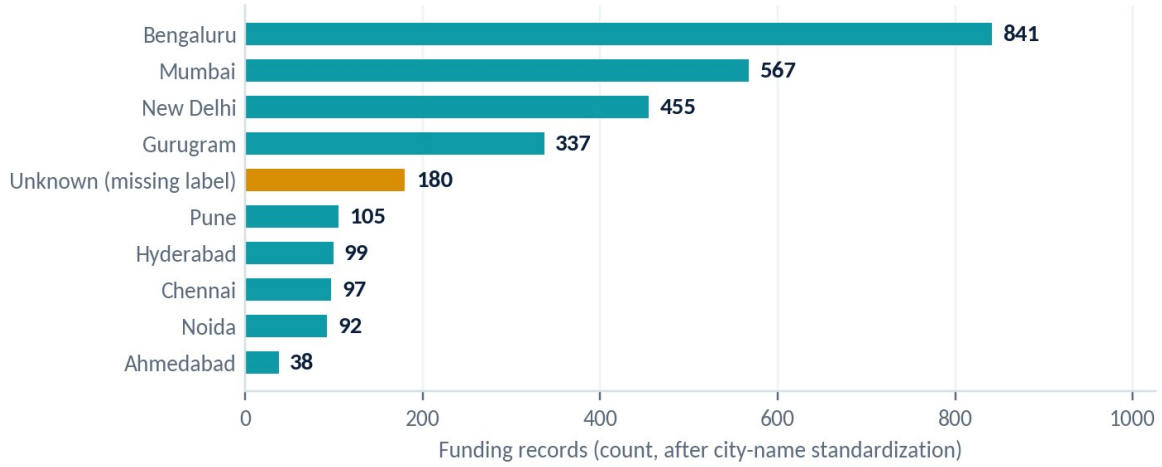

DERIVED FROM REPORTED FIGURES

Consumer Internet holds 941 of 3,044 records (about 31%), yet E-commerce, not Consumer Internet, leads industry funding (Q14).

Q4 City distribution

City variants were standardized before counting: Bangalore with Bengaluru, Gurgaon with Gurugram, and Delhi with New Delhi.

Chart 3 | Funding-record count by city (top 10, standardized)

Bengaluru (841), Mumbai (567), New Delhi (455) and Gurugram (337) lead on activity. 180 records have no city label.

KEY OBSERVATION

Record count measures activity, not capital received. City funding totals are in Q9.

Q5 Investment types and standardization

The source has 55 non-empty investment-type labels before standardization. Whitespace and selected Seed/Angel variants were standardized. Private Equity and Private Equity Round remain separate because a round label may not be equivalent to a broad investment category.

Standardized group	Rule applied
Seed Funding	Line breaks and extra whitespace removed
Seed/Angel Funding	Selected Seed/Angel and Angel/Seed spelling variants grouped
Private Equity	Kept separate from Private Equity Round
Other labels	Retained as source labels unless whitespace-only cleanup applied

KEY OBSERVATION

Document every category merge: standardizing labels changes each investment-type total.

06 Funding Analysis — Q6–Q10

Total and average funding by industry, startup, city and investment stage

Q6 Total funding

Total disclosed numeric funding is $38.07B. This is the sum of numeric amounts in the dataset, not a market-wide estimate; 978 rows have no usable numeric amount.

Q7 Average funding by industry

Only industry groups with at least three numeric funding amounts are included, to avoid averages driven by one-off categories.

Industry label	Numeric amount rows	Average amount
Transportation	4	$979.16M
FinTech	9	$135.63M
Food and Beverages	3	$100.10M
Health and Wellness	5	$98.04M
SaaS	3	$55.33M
Automobile	3	$54.67M
Transport	3	$50.67M
EdTech	3	$50.44M
E-commerce	203	$40.68M
Finance	57	$34.59M

DERIVED FROM REPORTED FIGURES

Transportation's average rests on four rows, and its $3.92B total (Q14) is almost entirely Rapido's $3.90B round. Treat it as a single-round effect, not an industry norm.

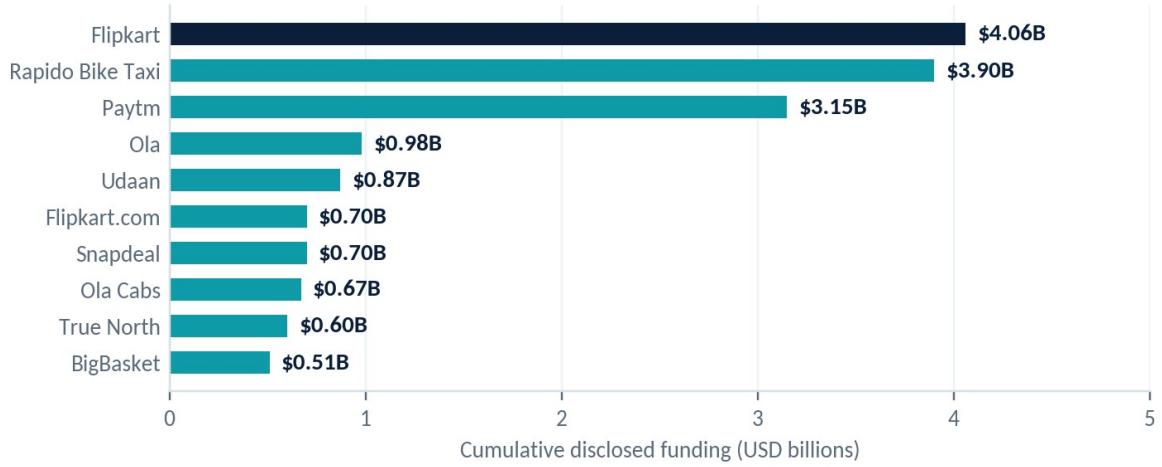

DATA LIMITATION

Several averages rest on only 3 to 9 rows, and Transportation, Transport and Automobile are separate labels, so this ranking should be read with care.

Q8 Top-funded startups by cumulative amount

Funding is aggregated by startup name, so a startup with several rounds can outrank one with a single large round.

Chart | Top 10 startups by cumulative disclosed funding

Flipkart leads cumulatively ($4.06B); Rapido Bike Taxi is second ($3.90B) on one record. The highest single round is not the highest cumulative funding.

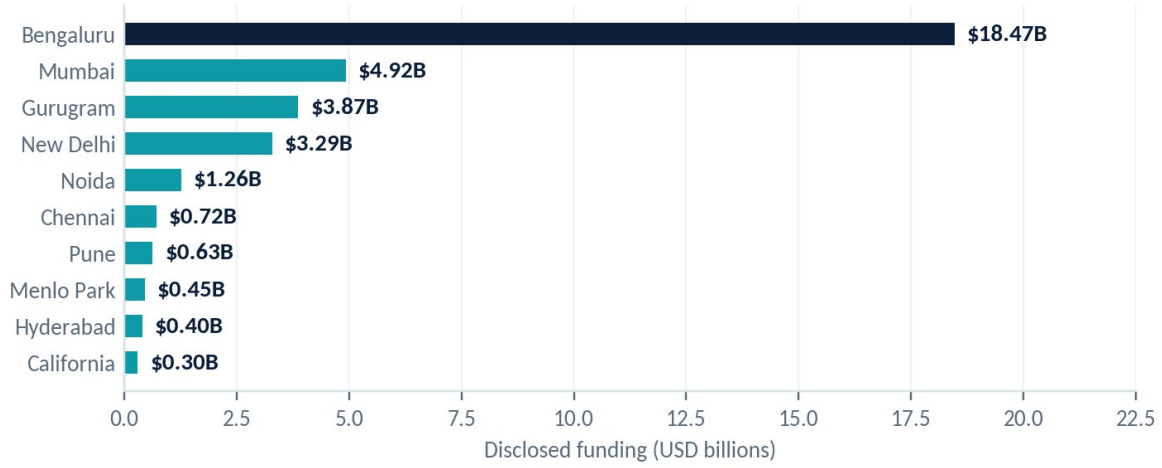

DATA LIMITATION

Name variants are not merged: Flipkart and Flipkart.com, and Ola and Ola Cabs, appear as separate startups, so their combined totals would be higher.

Q9 Funding by city

Cities ranked by total disclosed funding, which differs from ranking by number of records (Q4).

Chart | Disclosed funding by city (top 10)

Bengaluru leads by a wide margin ($18.47B), followed by Mumbai ($4.92B), Gurugram ($3.87B) and New Delhi ($3.29B).

DERIVED FROM REPORTED FIGURES

Bengaluru's $18.47B is about 48.5% of the $38.07B disclosed total.

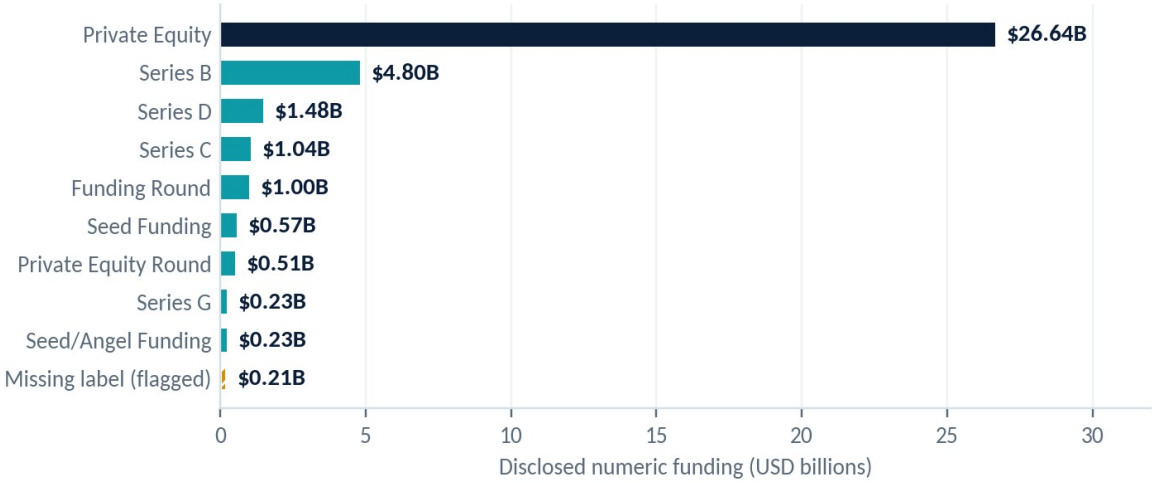

DATA LIMITATION

Some location labels are not cities or may be localities (California, India/Singapore, Kormangala), so city standardization is incomplete.

Q10 Investment-stage analysis

Total disclosed funding and the number of numeric-amount rows by investment type.

Chart 4 | Disclosed funding by investment type (top 10)

Private Equity dominates ($26.64B). Series B reaches $4.80B on just 20 numeric rows, while Seed Funding has 716 rows but only $0.57B.

DATA LIMITATION

The hatched bar has a missing investment-type label and $0.21B in funding but zero numeric amount rows. This inconsistency in the query output is recorded as a limitation and was not corrected.

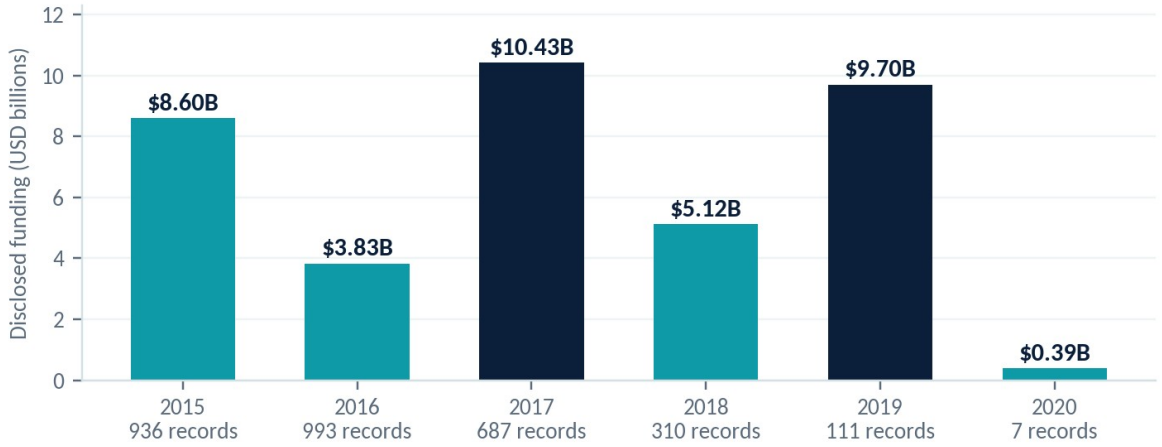

07 Time, Investor and Industry Analysis — Q11–Q15

Year and month trends, investor-name frequency, industry concentration, large rounds

Q11 Year-wise funding trend

Disclosed funding by year, with the number of records for each year.

Chart 5 | Disclosed funding by year

2017 ($10.43B) and 2019 ($9.70B) have the highest totals, yet 2015 and 2016 have the most records (936 and 993). Records in 2019 fall to 111.

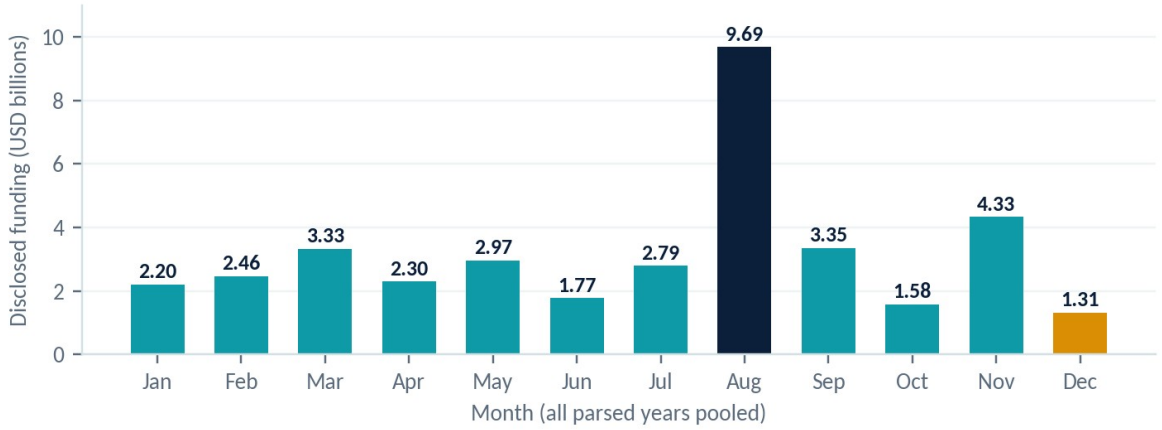

DERIVED FROM REPORTED FIGURES

Three rounds (Flipkart $2.5B and $1.4B, Paytm $1.4B) total $5.30B, about half of 2017's $10.43B. Rapido's $3.90B round is about 40% of 2019's total.

Q12 Monthly funding trend

Monthly totals are pooled across all parsed years.

Chart 6 | Disclosed funding by month, all years pooled

August is the peak ($9.69B) and December the lowest ($1.31B). The August peak is more than twice the next highest month (November, $4.33B).

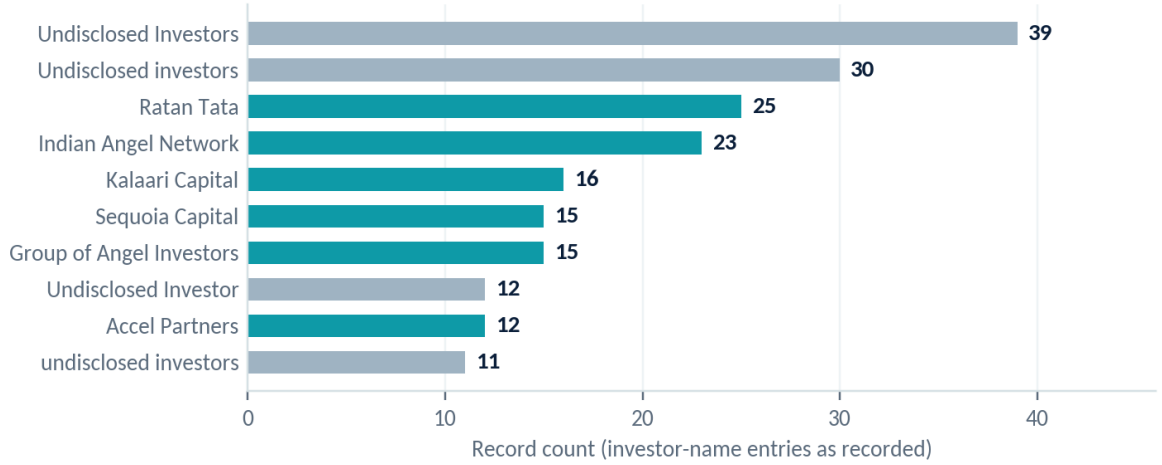

DERIVED FROM REPORTED FIGURES

Four of the ten largest records (Rapido, Flipkart, Snapdeal, True North) are dated August and total $7.50B of August's $9.69B. The peak reflects a few large rounds, not a seasonal pattern.

Q13 Most frequently recorded investor-name entries

Investor values are counted exactly as recorded. Grey bars are "undisclosed" variants, which are not individual investors.

Chart | Top investor-name entries by record count

Among named investors, Ratan Tata (25), Indian Angel Network (23), Kalaari Capital (16) and Sequoia Capital (15) are most frequent.

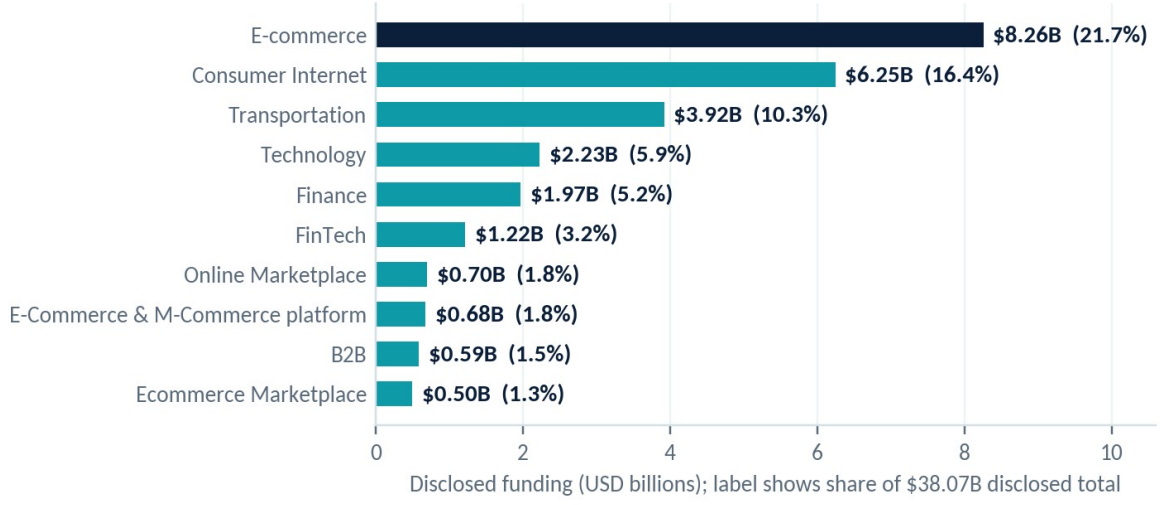

DATA LIMITATION

Some cells hold multiple investor names, and undisclosed variants differ only by spelling or case. This is a frequency of text entries, not a count of individual investor activity.

Q14 Industry funding concentration

Industry groups ranked by disclosed funding; shares use the full $38.07B as the denominator.

Chart 7 | Industry funding contribution (top 10)

E-commerce ($8.26B, 21.7%) and Consumer Internet ($6.25B, 16.4%) together hold about 38% of disclosed funding.

DATA LIMITATION

E-commerce variants (E-commerce, E-Commerce & M-Commerce platform, Ecommerce Marketplace) appear as separate labels here, despite the grouping rule in Section 04. Combined e-commerce funding is likely higher.

Q15 Funding rounds above the overall average

The benchmark is the $18.43M average across 2,066 numeric rows. The ten largest individual records above it are listed.

Startup	Industry label	Date	Amount
Rapido Bike Taxi	Transportation	2019-08-27	$3,900.00M
Flipkart	eCommerce	2017-08-11	$2,500.00M
Flipkart	eCommerce	2017-03-21	$1,400.00M
Paytm	ECommerce	2017-05-18	$1,400.00M
Paytm	FinTech	2019-11-25	$1,000.00M
Flipkart.com	Online Marketplace	2015-07-28	$700.00M
Paytm	E-Commerce & M-Commerce platform	2015-09-29	$680.00M
True North	Finance	2018-08-30	$600.00M
Udaan	B2B	2019-10-02	$585.00M
Snapdeal	Ecommerce Marketplace	2015-08-01	$500.00M

KEY OBSERVATION

The smallest of these ten rounds ($500M) is about 27 times the $18.43M average, which shows how skewed the distribution is.

08 Advanced SQL Analysis — Q16–Q20

Window functions, ranking, contribution analysis and a data-quality audit

Q	Analysis	Technique	What it answers	Status
Q16	Highest record per industry	RANK()	Largest individual record in each industry, ties retained	Amounts need $M
Q17	City ranking by funding	DENSE_RANK()	Cities ranked by total disclosed funding	Reported
Q18	Industry contribution	Percentage calc.	Share of the disclosed total by industry group	Labels unmerged
Q19	Year-over-year change	LAG()	Each year's total vs the previous year	Reported
Q20	Data quality audit	COUNT / CASE	Missing values and duplicate full rows	Reported

Q16 Highest individual funding record per industry

RANK() finds the largest record in each industry and retains ties. 579 industries have a numeric maximum; the first 15 (alphabetical) are shown.

Industry	Startup	Date
3D Printer Manufacturer	Fracktal Works	2015-06-18
API Workflow platform	Postman	2015-05-27
Accounting	Vyapar App	2019-09-03
Advertising & Marketing Community Networking platform	Kulzy	2015-10-09
Advertising, Marketing	Digital F5	2019-09-04
Aerospace	Dhruva Space	2019-12-03
Affordable Education	Seed Schools	2015-05-05
Affordable Hotel Booking Online	Casa2inns	2015-05-27
Agriculture	Sistema.bio	2019-06-06
Agtech	FreshVnF	2019-05-28
Alternate Mobile Monetization platform	Pokkt	2015-11-03
App Analytics platform	Retention.ai	2015-06-24
App based Bus Pooling Services	Shuttl	2015-12-03
App security testing platform	Appvigil	2015-08-06
Architectural Design & Consulting	Arth DesignBuild	2015-06-01

DATA LIMITATION

The query output shows these amounts in $B rounded to two decimals ($0.00B to $0.14B), which hides the values, so the amount column is omitted. A future version should report them in $M. One industry label also carried an encoding artifact (non-breaking space codes), which was cleaned.

Q17 City ranking by total funding

DENSE_RANK() ranks city groups by total disclosed funding after city-name standardization.

Rank	City group	Disclosed funding
1	Bengaluru	$18.47B
2	Mumbai	$4.92B
3	Gurugram	$3.87B
4	New Delhi	$3.29B
5	Noida	$1.26B
6	Chennai	$0.72B
7	Pune	$0.63B
8	Menlo Park	$0.45B
9	Hyderabad	$0.40B
10	California	$0.30B
11	Kormangala	$0.28B
12	Faridabad	$0.25B
13	India/Singapore	$0.23B
14	Tulangan	$0.20B
15	San Francisco	$0.19B

DATA LIMITATION

Ranks 8 to 15 include labels that are not cities or may be localities, so the lower part of this ranking is less reliable.

Q18 Industry contribution

Shares use the full disclosed total as the denominator, so named industries do not sum to 100%: rows with missing industry labels stay in the total.

Rank	Industry group (ranks 11-15; ranks 1-10 are in Chart 7)	Disclosed funding	Share
11	Car Aggregator & Retail Mobile App	$0.50B	1.3%
12	Health and Wellness	$0.49B	1.3%
13	Cab Aggregator	$0.40B	1.1%
14	Healthcare	$0.38B	1.0%
15	Education	$0.30B	0.8%

KEY OBSERVATION

The ranking is consistent with Q14 (E-commerce first). Several industry labels overlap (Cab Aggregator and Transportation; Health and Wellness and Healthcare), so grouped shares would be larger.

Q19 Year-over-year funding change

LAG() compares each year's total with the previous year. 2015 has no prior year.

Year	Funding	Previous year	Change	YoY %
2015	$8.60B	N/A	N/A	N/A
2016	$3.83B	$8.60B	-$4.77B	-55.5%
2017	$10.43B	$3.83B	+$6.60B	+172.4%
2018	$5.12B	$10.43B	-$5.31B	-50.9%
2019	$9.70B	$5.12B	+$4.58B	+89.4%
2020	$0.39B	$9.70B	-$9.31B	-96.0%

> **DERIVED FROM REPORTED FIGURES**
> The -96.0% change in 2020 compares a year with 7 records against 2019's 111, so it reflects far fewer records, not necessarily a collapse in funding conditions.

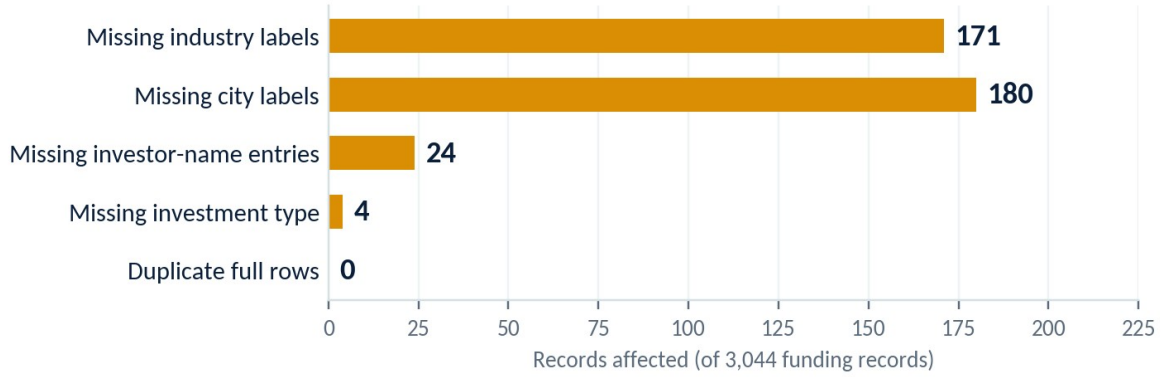

Q20 Data quality audit

The full audit is in Section 09. In short: no missing startup names, no unparsed dates, no duplicate full rows and no numeric zero amounts; 171 missing industry labels, 180 missing city labels and 978 unavailable amounts.

09 Data Quality and Methodology Notes

Audit results from the supplied CSV and the limitations recorded during the analysis

Chart 8 | Data quality dashboard

Missing labels concentrate in industry (171) and city (180). No duplicate full rows were found. The largest gap, 978 unavailable amounts, is shown in Section 03.

Check	Count	Interpretation
Rows	3,044	Source CSV records
Missing startup names	0	None after blank/placeholder cleanup
Missing industry labels	171	NULL, blank and literal nan treated as missing
Missing city labels	180	NULL, blank and literal nan treated as missing
Missing investor-name entries	24	No investor name recorded
Missing investment type	4	No investment type recorded
Amounts unavailable	978	Undisclosed, unknown and other non-numeric entries
Dates unparsed after fixes	0	All dates parsed
Duplicate full rows	0	Exact full-row duplicates only
Zero amount records	0	No numeric zero rows; minimum numeric amount is positive

How the denominator changes the average

Calculation	Result	Use in this report
$38.07B ÷ 2,066 numeric-amount rows	$18.43M	Used: the average of disclosed amounts
$38.07B ÷ 3,044 funding records	$12.51M	Not used: it treats the 978 undisclosed amounts as zero
Smallest numeric amount	$0.02M	No numeric zero rows exist; unavailable amounts are not zeros

Data limitations register

Item	What the data shows	How it was handled
Amount coverage	978 rows (32.1%) have no numeric amount	Totals quoted with coverage
$3.90B maximum	A single Rapido Bike Taxi record, about 10% of the disclosed total	Reported as recorded
Funding units	Column heading indicates USD	Assumed USD; no scaling
Name variants	Flipkart/Flipkart.com and Ola/Ola Cabs listed separately	Left unmerged; noted in Q8
Industry labels	E-commerce, Transportation and health variants split in Q7, Q14, Q18	Noted where relevant
Q10 missing-label row	$0.21B with zero numeric rows	Shown as a flagged bar
Q16 amounts	Rounded to $B in the query output	Amount column omitted
Investor entries (Q13)	Multiple names per cell; undisclosed variants	Counted as recorded
City labels	Non-city and locality labels in Q9 and Q17	Noted in Q9 and Q17
Q19, year 2020	Only 7 records	Noted in Q19

10 Analysis Practices and Improvements

Practices applied in this project and refinements for a future version

1 Report amount coverage

Funding totals are quoted with amount coverage because the total excludes 978 rows with undisclosed or non-numeric amounts.

2 Keep raw data unchanged

The raw CSV is left as is, and every transformation is documented in the analysis.

3 Apply one mapping

A future version should apply the same city, industry and investment-type mapping to every chart and query.

4 Separate counts and totals

Record counts, funding totals and unique startup-name counts answer different questions and are reported separately.

5 Parse investors carefully

Multi-investor cells could be split into individual entities once a defensible parsing rule is available.

6 Read large rounds in context

Very large rounds such as the $3.90B record are reported as found; their source context was not available, so they are not treated as representative.

11 Why Startup Funding Can Slow Down

General explanations, kept separate from what this dataset supports

Funding totals and record counts show how much funding was recorded, but not why funding slows. This section describes common reasons in general terms. They are possible explanations from general startup-finance knowledge, not causes demonstrated by this dataset.

SUPPORTED BY THIS PROJECT'S DATA

The yearly number of funding records rises slightly from 936 (2015) to 993 (2016), then falls to 687, 310, 111 and 7 by 2020, while yearly totals move up and down ($8.60B, $3.83B, $10.43B, $5.12B, $9.70B, $0.39B). Also, 978 of 3,044 records (32.1%) have no numeric amount. The data alone cannot show whether the decline in records reflects slower fundraising or differences in dataset coverage.

GENERAL EXPLANATION, NOT TESTED HERE

The dataset does not contain revenue, profitability, cash burn, runway, customer growth or company status. None of the ten factors below can be tested for any startup in this project.

#	Possible factor	How it could affect further fundraising
1	Low or inconsistent revenue	Without steady customer income, investors have little evidence that the business model works, which makes new investment harder to justify.
2	Lack of profitability	If operating expenses stay high compared with revenue, investors may doubt the startup can become sustainable and may expect lower returns.
3	High cash burn	Spending faster than money comes in shortens the time before more capital is needed and can make investors cautious.
4	Limited cash runway	With little cash to last until the next round, a startup has less time to raise funds and may have to accept weaker terms.
5	Weak product-market fit	If customers do not adopt or repeatedly use the product, investors may see low demand and hesitate to fund expansion.
6	Slow customer and business growth	Investors usually expect growth in users, customers or revenue; slower growth than expected can reduce interest in later rounds.
7	Strong competition	Competitors can reduce market share, pricing power or expected returns, making the opportunity less attractive.
8	Changing investor sentiment	Economic conditions, market uncertainty or sector-specific risks can make investors more cautious, reducing funding even for startups that are performing well.
9	Missed business milestones	Failing to meet previously communicated targets can reduce investor confidence in the startup's plans and forecasts.
10	Unclear path to sustainable growth	If a startup cannot explain how it will become financially sustainable, investors may hesitate to commit more capital.

DATA LIMITATION

A gap in funding records does not prove business failure. A startup may have no later record for many reasons, for example it may have been acquired, funded without a recorded round, or simply not captured in this dataset. Company status is not in the data, so no startup in this report is described as failed or successful.

12 Project Limitations and Future Scope

What the current analysis can and cannot show

This project focuses on funding-record analysis: how much funding was recorded, and how it varies by startup, industry, city, investment type and time. Its main limitations come from the data itself.

Current limitations

- 978 of 3,044 records (32.1%) have no numeric amount, so totals describe disclosed amounts only.
- 171 industry labels and 180 city labels are missing, and several labels have unmerged spelling variants.
- Investor-name cells can hold several investors, so Q13 counts text entries, not individual investors.
- The dataset has no information about revenue, costs or company status, so funding totals cannot be linked to business performance.

Future scope

A future version could add the following fields:

- Startup revenue and profit/loss data
- Operating costs and cash burn
- Customer growth and retention
- Funding-round dates and subsequent funding
- Acquisition, shutdown or active-status information

Combining these fields could help investigate whether revenue performance or other factors are associated with slower fundraising, for example by comparing the time between funding rounds across startups with different revenue trends.

13 Conclusion and SQL Techniques Used

Summary of the project and what could be improved

In this project I used SQL (MySQL) to analyze 3,044 startup funding records from startup_funding.csv. The dataset contains 2,459 distinct startup names and $38.07B in disclosed numeric funding, although only 2,066 records (67.9%) have a numeric amount.

Aggregation functions, GROUP BY and CASE helped me measure funding by startup, industry, city, investment type, year and month. Ranking functions (RANK and DENSE_RANK), LAG() and CTEs supported the advanced questions, and COUNT-based checks audited missing labels and duplicate rows. The results show that funding is concentrated: Private Equity accounts for $26.64B, Bengaluru for $18.47B, and a few very large rounds shape the yearly and monthly totals.

The project also shows why funding totals alone cannot tell whether a startup is successful or unsuccessful. A funding record shows how much was recorded, not whether the company earned revenue, was profitable, grew or survived, and a missing later record is not proof of failure.

In a future version I would clean labels with one consistent mapping, report amounts in a single unit such as $M, and add revenue, cost, growth and company-status data so that the factors in Section 11 could be tested rather than only described.

SQL techniques used

COUNT()	COUNT(DISTINCT)	SUM()	AVG()	MIN()
MAX()	GROUP BY	ORDER BY	CASE	CTEs
RANK()	DENSE_RANK()	LAG()	Percentage calculations	Data-quality checks

Startup Funding Analysis | SQL Data Analytics Project
